OTHER INFORMATION:
Reproductive toxicity: Animal feeding studies in rat, mouse, and dog at high doses, have demonstrated effects on fertility and testes (2). Studies with chemically related boric acid in rat, mouse, and rabbit, at high doses, demonstrate developmental effects on the fetus including fetal weight loss and minor skeletal variations. The doses administered were many times in excess of those which humans would normally be exposed to (3, 4, 5). Human epidemiological studies show no increase in pulmonary disease in occupational populations with chronic exposures to boric acid dust and sodium borate dust. A recent epidemiology study under the conditions of normal occupational exposure to borate dusts indicated no effect on fertility.
