

ENVIRO SOLUTION

GOLF COURSE DE-OILING TREATMENT

Golf Courses have an enormous problem with hot hydraulic oil spilling onto the grass from broken hydraulic lines on mowers. This oil kills the grass immediately, but the grass can not grow back because of the residual oil still on the grass. The application of the Enviro Solution digests the oil and removes it allowing the grass to heal itself.

In most cases grass can grow back in a few days.

Enviro Solution is an all-natural botanical blend of enzyme systems coupled with 12 strains of microbes, which accelerate the digestion of hydrocarbons in soil and water remediation applications. The live enzyme systems catalyze the cleavage and further digestion of the hydrocarbons into carbon dioxide, water and salts. The function of the microbes is to continually produce more enzymes to attack the hydrocarbons in the system.

A unique characteristic of the Enviro Solution is the ability of the microbes to adapt to the changing distribution of hydrocarbon by-products, and produce more of the enzymes needed to digest that particular type of chemical. The microbes are also supplied with nutrients which helps keep the efficiency of the system as close to 100% as possible.

These same nutrients also aide in increasing the population of microbes and enzymes through increased reproduction. This allows the statistics of the reaction to improve by increasing the number of collisions per second.

APPLICATION:

Dilute treatment solution to 10:1 with water. Spray on infected area and let stand repeat 3 times then put on regular seeding and nutrient schedule.
