

# PRODUCT BULLETIN

Date: 7/27/2023  
Product: **Kote**  
Product Code: #176701

---

As some of you may have seen on the Pro Chem Compass last night, a few sales associates have let us know that the Kote cans are not spraying, after 5 seconds of spraying. If the spray tip should close, try removing the spray tip and clean in solvent.

We had a few instances where this happened in the past, so the Directions on the Pro Chem website were updated a while back for this product. (See screenshot below.) We also notified the sales team a few weeks ago that this product is being discontinued, however we have about 3-4 months of inventory on hand. We are working to source a replacement product.

Going forward, in an effort to provide the best possible customer experience, if your customer has a problem with Kote or any other Pro Chem product, please contact the office and we will reach out to the supplier.

## **DIRECTIONS FOR USE**

Shake well before using. Make the can rattle 30 seconds before using. For proper spraying, can should be near room temperature (about 72°F/22°C). Parts to be sprayed should be reasonably clean and dry. Spray, holding can 12 to 14 inches from point to be lubricated. Make sure arrow on spray tip points away. For point lubrication, use plastic tube extension, insert into nozzle – for reaching places where a spray pattern is not desired. Spray may be applied holding can upside down, sideways, right side up...in almost any position. If spray tip should close, remove and clean in solvent.
